Lean Paper Project Template

Replace with author name

1 Linked statements

The blue headings below are semantic PDF links. After opening this PDF with Lean Paper Viewer, clicking a heading opens the corresponding declaration in the right-hand Lean editor.

Definition 1.1 (Twice). *For a natural number n, define*

$$\mathrm{twice}(n) := n + n.$$

Theorem 1.2 (Expansion of twice). *For every natural number n,*

$$\mathrm{twice}(n) = n + n.$$

Theorem 1.3 (Zero on the left). *For every natural number n,*

$$0 + n = n.$$

2 Links in ordinary prose

Links need not be attached to theorem headings. For example, the term *twice* refers to the function defined above. In an ordinary sentence, we can also link the assertion that adding zero on the left leaves a natural number unchanged. A short inline formula can be linked as well: $\mathrm{twice}(n) = n + n$.

These links reuse the same semantic IDs as the headings, so they open the same Lean declarations without additional manifest entries.

3 Adapting the template

Keep `\leanlink` in the preamble, but adapt `leanstatement` to the theorem style of the actual paper. Use stable semantic IDs and update `lean-paper-viewer.json` whenever a link is added or removed.
